

IN THE CLAIMS

Please substitute the following amended claims for corresponding claims previously presented. A copy of the amended claims showing current revisions is attached.

- 7. A method of fabricating a porous filter element according to claim 1, wherein the regions extend in a straight line from a first side of said photosensitive material to a second, opposite side of said material.
- 8. A method of fabricating a porous filter element according to claim 1, wherein the step of treating the exposed photosensitive material to selectively remove regions thereof comprises removing regions having an exposure below a predetermined level.
- 9. A method of fabricating a porous filter element according to claim 1, wherein the step of treating the exposed photosensitive material to selectively remove regions thereof comprises removing regions having an exposure above a predetermined level.
- 10. A method of fabricating a porous filter element according to claim 1, wherein the pattern is substantially non-varying through the depth of the material whereby said regions have a constant cross-section through the material.

- 2 -

- 11. A method of fabricating a porous filter element according to claim1, wherein the pattern varies through the depth of the material to vary the cross-section of said regions through the depth of the material.
- 12. A method of fabricating a porous filter element according to claim 10, wherein the pattern repeats across the material perpendicular to the depth direction to create in the material a regular array of identical regions which extend through the depth of the material.
- 13. A method of fabricating a porous filter element according to claim 1, wherein the material is a mixture of an epoxy resin and a photoacid generator.
- 14. A method of fabricating a porous filter element according to claim 1, wherein the material to be exposed is in the form of a thin film.
- 15. A method of fabricating a porous filter element according to claim 1 wherein the photosensitive material comprises a plurality of regions of different composition such that the different regions react differently to exposure followed by treatment.

17. A method of fabricating a porous filter element according to claim 1,

Zeomprising the further step of using said treated material as a lost mould to form a porous filter element.

20. A method according to claim 1 wherein the exposure time and/or intensity of the e.m. radiation is set selectively in accordance with the desired size of the regions.

21. A porous filter element made by the method of claim 1.
